## Response to Amendment and Argument

1. This communication is in response to applicant's 10/27/2006 response in the application of Hollums et al. for a "System, method and computer program product for scheduling burst profile changes based on minislot count" filed 06/18/2000. This application claims Priority from Provisional Application 60261273 filed 01/12/2001. The amendment and response has been entered and made of record. Claims 1-15 are pending in the application.

2. Applicant's amendment to the rejected claims are insufficient to distinguish the claimed invention from the cited prior arts or overcome the rejection of said claims under 35 U.S.C. 103 as discussed below. Applicant's remarks with respect to the pending claims have been fully considered, but they are not persuasive for at least the following reasons.

In response to Applicant's argument that the reference does not teach or reasonably suggest the functionality upon which the Examiner relies for the rejection. The Examiner first emphasizes for the record that the claims employ a broader in scope than the Applicant's disclosure in all aspects. In addition, the Applicant has not argued any narrower interpretation of the claim limitations, nor amended the claims significantly enough to construe a narrower meaning to the limitations. Since the claims breadth allows multiple interpretations and meanings, which are broader than Applicant's disclosure, the Examiner is required to interpret the claim limitations in terms of their broadest reasonable interpretations while determining patentability of the disclosed invention. See MPEP 2111. In other words, the claims must be given their broadest reasonable interpretation consistent with the specification and the

interpretation that those skilled in the art would reach. See In re Hyatt, 211 F.3d 1367, 1372, 54 USPO2d 1664, 1667 (Fed. Cir. 2000), In re Cortright, 165 F.3d 1353, 1359, 49 USPQ2d 1464, 1468 (Fed. Cir. 1999), and In re American Academy of Science Tech Center, 2004 WL 1067528 (Fed. Cir. May 13, 2004). Any term that is not clearly defined in the specification must be given its plain meaning as understood by one of ordinary skill in the art. See MPEP 2111.01. See also In re Zletz, 893 F.2d 319, 321, 13 USPQ2d 1320, 1322 (Fed. Cir. 1989), Sunrace Roots Enter. Co. v. SRAM Corp., 336 F.3d 1298, 1302, 67 USPQ2d 1438, 1441 (Fed. Cir. 2003), Brookhill-Wilk 1, LLC v. Intuitive Surgical, Inc., 334 F.3d 1294, 1298 67 USPQ2d 1132, 1136 (Fed. Cir. 2003). The interpretation of the claims by their broadest reasonable interpretation reduces the possibility that, once the claims are issued, the claims are interpreted more broadly than justified. See In re Prater, 415 F.2d 1393, 1404-05, 162 USPQ 541, 550-551 (CCPA 1969). Also, limitations appearing in the specification but not recited in the claim are not read into the claim. See In re Van Geuns, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). Therefore, the failure to significantly narrow definition or scope of the claims and supply arguments commensurate in scope with the claims implies the Applicant intends broad interpretation be given to the claims. The Examiner has interpreted the claims in parallel to the Applicant in the response and reiterates the need for the Applicant to distinctly define the claimed invention.

Applicant's argument with respect to the rejected claim 1 that the cited references fails to disclose or suggest "sends the parameters to the physical layer device at the predetermined changeover time" as claimed. However, <u>DOCSIS</u> standard provides a method in which PHY parameters (i.e, a burst profile) can be <u>changed</u>. Such a change requires a reprogramming of components that handle PHY processing, including PHY devices at the headend. Furthermore,

Art Unit: 2616

In conventional DOCSIS systems, the CMTS may transmit a DCC Request (DCC-REQ) message to cause a CM to change the upstream channel on which it is transmitting, the downstream channel it is receiving, or both. The "Upstream Channel Change" or "Dynamic Channel Change" is a standard mechanism in the DOCSIS protocol and permits the cable modem to remain connected during a change to the upstream port mappings. Either or both of the downstream and upstream channels can be changed on the fly. This allows for load balancing of channels, which can improve robustness. As admitted by the Applicant as the prior art shown in Fig. 1 and in the specification [0003]-[0013] for parameter change process for headend PHY devices, in which in step 135, the MAP message is sent downstream. In step 140, the changeover point arrives (i.e., the start of first minislot of the dead time, as specified in the MAP message) and a central processing unit (CPU) at the headend is interrupted. This interrupt must be handled during the dead time. In step 145, the new parameters are written, via a port of the CPU, to the headend PHY device. The write process is driven by software executing on the CPU. The process concludes at step 150. Therefore, this statement constitutes an admission of prior art. See MPEP 2129 and Riverwood Int'l Corp. v. R.A. Jones & Co., 324 F.3d 1346, 1354, 66 USPQ2d 1331, 1337 (Fed Cir. 2003).

Since no substantial amendments have been made and the Applicant's arguments are not persuasive, the claims are drawn to the same invention and the text of the prior art rejection can be found in the previous Office Action. Therefore, the Examiner maintains that the references cited and applied in the last office actions for the rejection of the claims are maintained in this office action.

Art Unit: 2616

### Claim Rejections - 35 USC ' 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 5. Claims 1-5, 7-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bisceglia et al. (US#6,275,498) in view of Sambamurthy et al. (US#6,108,713).

With respect to claims 1-4, Bisceglia et al. (US#6,275,498) in view of Sambamurthy et al. (US#6,108,713) disclose a novel system and method for changing upstream physical layer parameters in a head-end physical layer device of a communication system, according to the

Page 6

Art Unit: 2616

essential features of the claims. Bisceglia et al. discloses in Fig. 3 a block diagram illustrated a system for changing one or more PHY communication parameters (44) includes a controller being operative to produce bus selection output signals and the control logic being responsive to the bus selection output signals to selectively couple one of the plurality of serial bidirectional control buses to the second bus interface to permit message communication. between the controller and a specified one of the at least one PHY coupled to the selected serial bidirectional control bus. The controller being operative to store information corresponding to at least a portion of a PHY management message within a transmit descripter associated with the serial peripheral interface and to forward a command to the serial peripheral interface to initiate transmission of the at least a portion of the PHY management message contained in the transmit descripter to a selected PHY coupled to one of said control buses specified by the bus selection output signals via the second bus interface, wherein the transmission over the second bus interface proceeds independently of, and concurrently with, the control program execution within the controller (Col. 11, lines 29 plus). Note that a serial peripheral interface (SPI) is employed to control the interface between MAC layer components and PHY layer components for a mutual data transmission. Such an interface employs handshaking as a way of transmitting and receiving signals such as an information request, a transmission check, a reception check, and the like to perform the mutual data transmission, and it's well known in the art.

Bisceglia et al. does not explicitly disclose the step of sending the parameters to the physical layer device at a predetermined time. However, the above mentioned claimed limitations are taught by Sambamurthy (US#6,108,713). In particular, Sambamurth teaches a

Art Unit: 2616

monitoring circuit (see Fig. 2, a combined system of micro RISC stream processor 114 and Super MAC management 117) sending a message (see Fig. 2, an instruction/message is sent to/from the combined management system) to the transmitter (see Fig. 2, Tx Super MAC controller 118) to change a physical layer parameter responsive to the collected statistics (see col. 10, lines 42 to col. 11, lines 52; Also see col. 12, lines 32-42). Note that the combined management system sends the management/control command/instruction to the transmitter to change/modify the physical layer parameter/limitation according to the stored statistics) and to the receiver (see Fig. 2, Rx Super MAC Controller 120) to process data signals based on the changed parameter (see col. 10, lines 42 to col. 11, lines 52; Also, col. 12, lines 32-42). Note that the combined management system sends the management/control command/instruction to the receiver to process the packet/data/signal according to the changed/modified the physical layer parameter/limitation (see col. 12 lines 56 to col. 13, lines 37; Also see Fig. 3).

With respect to claims 5, 7, the combined system of Bisceglia and Sambamurthy disclose the monitoring circuit send s a message to change the physical layer parameter as described in the claims above, Sambamurthy et al. further teach in Fig. 2 a architectural diagram illustrated a flow based Media Access Controller (MAC) 150 for high speed transmission, in which a FIFO Tx 106 acts as a buffer (e.g., RAM memory) for holding data that is being transmitted from the upper LLC layer through network data system bus 101. The FIFO Tx 106 is preferably capable of storing up to ten or more packets of data. Once a suitable number of packets are buffered in FIFO Tx 106, a network flow managing FIFO Tx controller 110 is implemented to manage the high speed flow of packets from FIFO Tx 106 into a micro RISC stream processor 114a. At a higher level, network flow managing FIFO Tx controller 110

may be responsible for prioritizing the different types of data being transferred across a network, such as audio, video, graphics, etc. In this manner, flow based MAC 150 is capable of having multiple simultaneous streams of data flowing through FIFO Tx 106 at one time (Col. 7, lines 38 plus, and Col. 38, line 37 plus).

Page 8

Regarding claims 8-13, they are method claims corresponding to the system claims 1-5, 7 above. Therefore, claims 8-13 are analyzed and rejected as previously discussed with respect to claims 1-5, 7.

One skilled in the art would have recognized the need for effectively and efficiently changing one or more PHY parameters as configured in a PHY device, and would have applied Sambamurthy's teaching of a mechanism of sending a message/instruction to the receiver to process the packet/data/signal into Bisceglia's novel use of a PHY signal control device.

Therefore, It would have been obvious to a person of ordinary skill in the art at the time of the invention was made to apply Sambamurthy's MAC architectures and network management systems into Bisceglia's extended PHY addressing with the motivation being to provide a method and system for changing PHY parameters in a PHY device of a communication system. The motivation being that by instructing the receiver in order to synchronize with the transmitter, it will reduce the error or failures due to mismatch processing of data between transmit and receive signals/data.

### Allowable Subject Matter

6. Claims 6 and 14-15 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Art Unit: 2616

The following is an examiner's statement of reasons for the indication of allowable subject matter: The closest prior art of record fails to disclose or suggest wherein the control registers further store a channel identifier, which corresponds to a communications channel to which the parameters pertain, and further comprising the step of: (f) receiving periodic updates of the current time, performed before step (e).

#### Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

The Grimwood et al. (US#6,459,703) is cited to show mixed DOCSIS 1.0 TDMA bursts with SCDMA transmissions on the same frequency channel.

The Lacey, III (US#6,952,430) is cited to show system and method for interfacing a data link protocol engine and a physical layer.

The Cole (US#6,714,589) is cited to show communication device with primitive synchronization signal.

The Grand et al. (US#7,110,398) is cited to show packet tag for support of remote network function/packet classification.

The Denney et al. (US#7,006,535) is cited to show method and system for providing time offset to ministot clock and count in headend devices.

The Vogel et al. (US#6,963,541) is cited to show upstream transmission profiles for a DOCSIS or DOCSIS like system.

The Hou (US#6,898,755) is cited to show the method for increasing physical layer

Art Unit: 2616

flexibility in cable modem systems

8. THIS ACTION IS MADE FINAL. See MPEP '706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to M. Phan whose telephone number is (571) 272-3149. The examiner can normally be reached on Mon - Fri from 6:00 to 3:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wellington Chin, can be reached on (571) 272-3134. The fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300. Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (571) 272-2600.

Art Unit: 2616
